

An article by the National Oceanic and Atmospheric Administration (2021) entitled “Climate Change Impacts” tackles about the effects of climate change in our society from our sources of sustenance, human health, infrastructures, and our environment. Lesser impacts are beneficial, but most of the effects are damaging and threatening. Climate change doesn’t only refer to an increase in temperature, it also describes how much the sea level rise, how the weather pattern changes, and much more. These changes are mostly anthropogenic, and it is our duty to be aware and learn how to resolve and lessen the damage and its negative effects.

Climate change had already started way back before the modern civilization, and it is not as worse as it has been in the contemporary days. Nature is beautiful yet it still finds its way to cause chaos for its organisms on Earth. Not all impacts were caused by the humankind, in today’s society, most of it are anthropogenic. In the given article, it does not only focus on a single subject, but it includes all the major needs of a society which makes the issue unbiased to its subject. The article is well researched, only giving facts and reliable information source. Some highlighted words also give the meaning of those words which we will be directed to another article/site. The structure of the article is well-organized and written well for the readers to understand. Additional visuals made it aesthetically pleasing to the eye and overwhelming to look at. The writing style is formal, yet very interesting to read which makes it suitable for its intended readers such as students and adults. Overall, the format of the article is impeccable and the content is well written.
