

Mohammed et al (2020)., has made a study entitled Artificial Intelligence and COVID-19: Deep Learning Approaches for Diagnosis and Treatment. COVID-19 had greatly impacted the nation. Millions became infected and many have lost their lives. But unlike the Black Plague that happened ages ago, we now had modern and innovated technologies to support us from making a solution for this global pandemic. Though it is yet to be used, researchers are now considering the use of Artificial Intelligence (AI) in helping with the medical field to have an efficient working system, and most importantly, to save more people's lives. In order to make it happen, researchers have started to create a study by starting to combat the situation in COVID-19.

In accuracy and reliability, computer technology has been proven to be better at it. Though it is rare to see a computer make a mistake, it is still a thing to take note and consider. The COVID-19 pandemic had made the world into shambles turning citizens into hoarders and made everyone feel panic about the current situation. Instead of working things out rapidly, there are many who didn't take the whole thing seriously making them and us suffer from the consequences of their choice. Infected and number of deaths rose immediately, and with the increasing amount of data relating to the virus, it is something that would take a lot of our time if we people did it manually. In times like this, fast and accuracy is needed for each field to work on efficiently and Artificial Intelligence is our best bet. There are times that I do not trust technology, but I know for a fact that it is smarter than me. Though it doesn't have the ability to think on its own, we command things for it that they can do more faster than a human can. However, without the help of humanity, computers will cease to exist.
